

# N32H482xE

# Datasheet

N32H482 series adopts a 32-bit ARM Cortex-M4F core, with a maximum operating frequency of 240MHz, supporting floating-point unit and DSP instructions. It integrates up to 512-KB embedded flash, 192-KB SRAM (including 32-KB CCM SRAM), and 4-KB Backup SRAM. It also integrates 4x 12bit 4.7Msps ADCs, 2x 12bit DAC, USB FS Device, USB HS DualRole, U(S)ART, I2C, SPI, CAN-FD, and other communication interfaces. It supports SDIO, FEMC, xSPI high-speed storage interfaces, I2S audio interface, multiple advanced control timers, general timers, basic timers, low-power timers. It also features a built-in hardware acceleration engine for cryptographic algorithms, supporting AES/TDES, SHA, SM3, SM4, MD5 algorithms, TRNG true random number generator, and CRC16/32.

## Key Features

### ● CPU Core

- 32-bit ARM Cortex-M4F + FPU, single-cycle hardware multiplication and division instruction, support DSP instruction and MPU
- Built-in 8-KB instruction Cache supporting Flash acceleration unit for zero-wait program execution
- Frequency up to 240 MHz, 300 DMIPS

### ● Memories

- 512-KByte of embedded Flash memory with ECC
  - ◆ Supports encryption, multi-user partition and data protection
  - ◆ 100,000 erase/write cycles and 10-years data retention
- 160-KByte of general SRAM with hardware parity checking
- 32-KByte of CCM SRAM with ECC, defaults to general SRAM after power-up, configurable as CCM SRAM
- 4-KByte of Backup SRAM with ECC available in Standby mode

### ● Power Modes

- Run mode: 45 mA/MHz@240 MHz (peripherals off, 3.3 V@25°C)
- Stop0 mode: SRAM and all registers can be configured to retention, RTC run
- Standby mode: 6uA, all backup registers and Backup SRAM retained, all IOs retained, optional RTC run
- VBAT mode: 4uA, all backup registers and Backup SRAM retained, optional RTC run

### ● Clock

- HSE: 4MHz~32MHz high-speed external crystal oscillator
- LSE: 32.768KHz low-speed external crystal oscillator
- Built-in multiple high speed PLLs
- MCO: Supports 2-channel clock outputs, which can be configured independently as clock output
- HSI: High-speed internal RC 8MHz, -1.5% to +2% accuracy (full temperature range)
- LSI: Low-speed internal RC 32KHz, +/-10% accuracy (full temperature range)

### ● Reset

- Supports power-on/brown-out/external pin reset

- Supports watchdog reset
- Supports programmable voltage detection

- **GPIOs**

- Up to 118 GPIOs

- **Communication Interfaces**

- 1x USB2.0 FS Device interface, built-in PHY, supports crystal-less mode
- 6x SPI interfaces, 2x I2S interfaces, support half/full duplex mode, multiplexed with SPI interfaces
- U(S)ART interfaces
  - ◆ 4x USART interfaces (support ISO7816, IrDA, LIN)
  - ◆ 4x UART interfaces
  - ◆ TX/RX of USART3/UART5/UART8 can be mapped to all pins
- 4x I2C interfaces(Master/Slave) with speed up to 1 MHz where slave mode support dual address response
- 2x CAN-FD bus interface, TX/RX can be mapped to all pins

- **High Performance Analog Interfaces**

- 4x 12bit ADCs with 4.7Msps
  - ◆ Multiple precision configuration, support 12-bit, 10-bit, 8-bit, 6-bit sampling precision, resolution up to 16-bit with hardware oversample
  - ◆ Up to 16 external single-ended input channels, 3 internal single-ended input channels, support differential mode and single-ended mode
- 2x 12bit DAC with 1Msps sampling rate
  - ◆ Each DAC support 1 internal output channel and 1 external output channel
  - ◆ Support output channel buffered/unbuffered modes, supports internal output, external output, and simultaneous internal and external output.
- 1x temperature sensor

- **High Speed External Memory Interfaces**

- 1x xSPI interface, supporting external SRAM, PSRAM and Flash, supporting XIP
- 1x FEMC (Flexible External Memory Controller) interface, supporting external SRAM, PSRAM, NOR Flash and NAND Flash, 8/16-bit data bus width configurable
- 1x SDIO interface, support SD/SDIO/MMC format

- **Mathematical hardware accelerator CORDIC for motor control functions**

- **Built-in filter mathematical accelerator FMAC, supporting FIR, IIR filtering**

- **DMA Controllers**

- 2x DMA controller
- Each controller supports 8 channels
- Channel source address and destination address can be configured arbitrarily

- **RTC real-time clock**

- Supports leap-year calendar, alarm event, periodic wake up
- Supports internal and external clock calibration

- **Timers**

- 3x 16-bit advanced control timers with maximum control precision of 4.16 ns
  - ◆ Support input capture, complementary output, quadrature encoder input etc.
  - ◆ Each timer has 6 independent channels, 4 of which support 4 pairs of complementary PWM output.
- 10x 16-bit general purpose timers (GTIM1~10)
  - ◆ GTIM1~7, with a maximum control precision of 5.56ns, each timer has up to 4 independent channels, each channel supports input capture, output comparison, PWM generation, and single-pulse mode output.
  - ◆ GTIM8~10, with a maximum control precision of 4.16ns, each timer has up to 4 independent channels, each channel supports input capture, output comparison, PWM generation, and single-pulse mode output, only channel 1 supports complementary output with dead time, supports break input.
- 2x 32-bit basic timers
- 2x 16-bit low-power timer, can operate in Stop0 and Standby mode.
- 1x 24-bit SysTick timer.
- 1x 14-bit Window Watchdog (WWDG)
- 1x 12-bit Independent Watchdog (IWDG)

- **Programming Methods**

- Support SWD/JTAG debugging interface.
- Support UART and USB Bootloader

- **Security Features**

- Flash encryption, multi-user partition management unit (SMPU)
- Supports write protection (WRP), multiple read protection (RDP) levels (L0/L1/L2)
- Built-in hardware acceleration engine for cryptographic algorithm
- Supports AES/TDES, SHA, SM3, SM4, and MD5 algorithms
- True random number generator(TRNG)
- CRC16/32 operation
- Supports secure boot, program encryption download, secure firmware update
- Supports external clock failure detection, anti-tamper detection.

- **96-bit UID and 128-bit UCID**

- **Operating Conditions**

- Operating voltage range: 1.8V~3.6V
- Operating temperature range: -40°C ~ 105°C

- ESD:  $\pm 4\text{KV}$  (HBM model),  $\pm 1\text{KV}$  (CDM model)
  - EFT: VDD (+/-4KV, level A), I/O (+/-2KV, level A)
- **Packages**
    - LQFP64(10mm  $\times$  10mm)
    - LQFP100(14mm  $\times$  14mm)
    - LQFP144(20mm  $\times$  20mm)

## 1 Introduction

The N32H482 microcontrollers series features a high-performance 32-bit ARM Cortex™-M4F core with an integrated floating point operation unit (FPU) and digital signal processing (DSP). It operates at a frequency of up to 240MHz. It integrates up to 512-KB embedded flash, 192-KB SRAM (including 32-KB CCM SRAM), and 4-KB Backup SRAM. It also integrates 4x 12bit 4.7Msps ADCs, 2x 12bit DAC, USB FS Device, USB HS DualRole, U(S)ART, I2C, SPI, CAN-FD, and other communication interfaces. It supports high-speed storage interfaces like SDIO, FEMC, xSPI , as well as I2S audio interface, The microcontroller fature multiple advanced control timers, general timers, basic timers, low-power timers. It also features a built-in hardware acceleration engine for cryptographic algorithms, supporting AES/TDES, SHA, SM3, SM4, MD5 algorithms, along with a TRNG true random number generator, and CRC16/32.

The N32H482 series products can operates reliably in the temperature range of -40 °C to +105 °C and supply voltage from 1.8V to 3.6V. It offers multiple power modes to cater to low-power applications.

Figure 1-1 shows the bus block diagram of this series of products.

Notes:

(1) CCM SRAM is powered up as general SRAM by default, and users can configure it as CCM SRAM.

- (2) Supports break input, Channel 1 supports complementary channel output.
- (3) Only supports address bus and data bus multiplexing.

## 2 Functional Overview

### 2.1 Processor Core

The N32H482 series integrates the ARM Cortex™-M4F processor. It features a floating-point processing unit (FPU), DSP and parallel computing instructions, providing excellent performance of 300 DMIPS. At the same time, its efficient signal processing capabilities combined with low power consumption, low cost, and ease of use advantages of the Cortex-M series processors. Make it suitable for applications that need a mix of control and signal processing capabilities in an easy-to-use manner.

The ARM Cortex™-M4F 32-bit reduced instruction set processor offers outstanding code efficiency.

### 2.2 Memories

The N32H482 series includes embedded encrypted Flash memory and embedded SRAM. The following diagram shows the memory address mapping.

## Figure 2-1 Memory Map

## 2.2.1 Embedded FLASH Memory

The integrated encrypted Flash memory size is up to 512 Kbytes, utilized for storing programs and data. The page size is 8Kbytes, supporting page erasing, double-word writing, word reading, half-word reading, and byte reading operations.

It supports storage encryption protection, enabling automatic encryption during writing and automatic decryption during reading (including program execution operation).

User partition management is supported, allowing for a maximum of 3 user partitions, different users cannot access each other's data (only executable code can be accessed).

## 2.2.2 Embedded SRAM

The chip integrates a built-in SRAM of up to 192 Kbytes (including 160 Kbytes general SRAM and 32 Kbytes CCM SRAM) and a Backup SRAM of 4 Kbytes, as follows:

General SRAM has a maximum size of 160 Kbytes, supporting parity check.

CCM SRAM has a size of 32 Kbytes, powered up as general SRAM by default, can be configurable as CCM SRAM, supporting ECC.

BKP SRAM has a size of 4 Kbytes, can retain data in VBAT and Standby mode, supporting ECC.

## 2.2.3 Nested Vector Interrupt Controller (NVIC)

Main features:

- Up to 102 maskable interrupt channels (not including the 16 interrupt lines of Cortex-M4F)
- 16 programmable priority levels (four bits of interrupt priority used)
- Low-latency exception and interrupt handling
- Power management control
- Implementation of system control registers

The NVIC and the processor core interface are closely coupled, enabling low-latency interrupt processing and efficient processing of late arriving interrupts. All interrupts, including the core exceptions, are managed by the NVIC.

## 2.3 Extended Interrupt/Event Controller (EXTI)

The extended interrupt/event controller contains 24 edge detectors used for generating interrupt/event requests. Each interrupt line can be independently configured with its trigger event (rising edge, falling edge or both) and can be individually masked. The pending register holds interrupt requests for the status lines, and the interrupt requests can be cleared by writing '1' to the corresponding bit in the pending register.

## 2.4 Clock System

The device offers various clock options for users to choose from, including:

- High speed internal RC oscillator (HSI) at 8 MHz
- Low speed internal RC oscillator (LSI) at 32 KHz
- High speed external crystal oscillator (HSE) ranging from 4 MHz to 32 MHz.
- Low speed external crystal oscillator (LSE) at 32.768 KHz.

The system clock source can be selected from HSI, HSE, PLL, SHRTPLL, USBHS240M. Upon reset, the internal MSI clock is set as the default system clock, user can choose the external HSE clock with fail monitoring capabilities. When an external clock failure is detected, it will be isolated, the system will automatically switch to HSI. If interrupts are enabled, software can receive corresponding interrupts.

Multiple prescalers are used to configure the AHB frequency, high speed APB (APB2) and low speed APB (APB1) regions. The AHB has a maximum frequency of 240 MHz, APB2 has a maximum frequency of 180 MHz and APB1 has a maximum frequency of 180 MHz.

Refer to the clock tree diagram below.

**Figure 2-2 Clock Tree**

## 2.5 Boot Modes

During startup, the BOOT mode after reset can be selected through the BOOT0 pin and option byte for BOOT configuration:

- Boot from Main Flash memory, including booting from the front bank (0x0800\_0000) and rear bank (0x0804\_0000) of Main Flash
- Boot from system memory
- Boot from embedded SRAM

The Bootloader is stored in the system memory and can program the flash memory through USART1 or USB interface.

Address remapping for physical address 0 can also be achieved by configuring RCC\_BOOTREMAP.REMAPSEL[2:0]:

- Boot from xSPI external memory through remap
- Boot from FEMC external memory through remap

## 2.6 Power Supply Scheme

There are four external power supplies: VDD, VDDA, VREF, VBAT. Among them, VDD is the chip power supply, mainly for the power supply system and clock system; VDDA is the analog peripheral power supply, mainly for the analog peripherals; VREF provides a reference power supply for the analog peripherals to provide higher accuracy. VBAT is connected to the battery to provide power for the backup domain.

There are five power domains, powered by external power supplies for different power domains:

- V<sub>DD</sub> domain: 1.8 to 3.6V, mainly powering for MR, most GPIOs, HSE, HSI, PLL, POR/PDR, BOR, PVD, and USB PHY
- V<sub>DDA</sub> domain: 1.8 to 3.6V, mainly powering for ADC, DAC, TS, etc.
- V<sub>DDBK</sub> domain: 1.8 to 3.6V, mainly powering for WKUP pin, NRST, PC13/14/15, LSE, LSI, etc.
- V<sub>DDD</sub> domain: 1.1 V or 0.9 V, mainly powering for CPU, AHB, APB, SRAM, FLASH, RCC, TRNG, and most peripherals
- V<sub>DDDBK</sub> domain: 0.9 V or 0.8 V, mainly powering for PWR, Backup SRAM (4KB), RTC, LPTIM, WKUP pin, NRST, PC13/14/15, backup IOM, IWDG, and RCC\_BDCTRL register.

## 2.7 Reset

POR and BOR circuits are integrated inside the device. This part of the circuit ensures that the system works stably when the power supply exceeds 1.8V. When V<sub>DD</sub> falls below a set threshold (V<sub>POR/BOR</sub>), the device goes into reset state without using an external reset circuit.

## 2.8 Programmable Voltage Detector

The device has a built-in programmable voltage detector (PVD), which monitors the power supply of V<sub>DD</sub> and compares it with the threshold V<sub>PVD</sub>. When V<sub>DD</sub> is lower or higher than the threshold V<sub>PVD</sub>, an interrupt will be generated. The interrupt handler can send a warning message, and the PVD function needs to be enabled through the program. See **Table 4-6** for values of V<sub>POR/PDR</sub> and V<sub>PVD</sub>.

## 2.9 Low Power Mode

The N32H482 series supports four low-power modes.

- SLEEP mode

In SLEEP mode, only the CPU is stopped, all peripherals remain operational and can wake up the CPU when an interrupt/event occurs.

- STOP0 mode

STOP0 mode is based on the Cortex-M4F deep sleep mode. Achieves the lowest power consumption, while retaining the content of SRAM and registers. Most clocks in the main power domain are stopped, such as PLL, HSE, HSI.

Wakeup: The device can be woken up from STOP0 mode by any of the 16 external EXTI signals (I/O related), PVD output, RTC timestamp, RTC alarm, etc.

- STANDBY Mode

In STANDBY mode, the device can achieve a lower current consumption. The internal voltage regulator is turned off, as well as PLL, HSI RC oscillator and HSE crystal oscillator. After entering STANDBY mode, most register contents will be lost, while the contents of backup registers will still be retained. The STANDBY circuitry continues to function.

Wakeup: External reset signal on NRST, IWDG reset, rising/falling edge on the WKUP pin, RTC alarm, RTC timestamp and LPTIM wake-up event can wake up the device from STANDBY mode.

- VBAT Mode

Whenever VDD power is lost, it will automatically enter VBAT mode. In VBAT mode, except for NRST, WKUP, PC13\_TAMPER, PC14, and PC15, most I/O pins are in a high-impedance state.

Wakeup: VDD power up.

## 2.10 Direct Memory Access (DMA)

The DMA controller can access the following slaves: Flash, SRAM1, SRAM2, CCM SRAM3, FEMC, XSPI, CRC, SDIO, FMAC, CORDIC, APB1, APB2, ATIM, ADC, DAC.

The DMA controller is controlled by the CPU to perform fast data transfers from source to destination. After configuring, data can be transferred without any CPU intervention. This keeps the CPU resources free for other operations or saves overall system power consumption.

The device integrates two DMA controllers (DMA1, DMA2), each DMA supports eight channels. Each channel is dedicated to servicing memory access requests from one or more peripherals. Each controller has an arbiter for handling the priority between DMAchannels.

The key features are as follows:

- 16 independently configurable channels (requests): Each DMA (DMA1, DMA2) supports 8 channels
- Support memory-to-memory, peripheral-to-memory and memory-to-peripheral transfers
- Each channel is connected to a dedicated hardware DMA request, a software trigger is also supported on each channel. This configuration is done by software.
- Each DMA channel has a dedicated software priority level (DMA\_CHCFGx.PRIOLVL[1:0] bits, corresponding to 4 priority levels) that can be individually configured. Channels with the same priority level will further compare the hardware index (channel number) to determine the final priority (the channel with the lower index number has higher priority).
- Configurable source and destination transfer size (byte, half word, word). Source/destination addresses must be aligned on the data size.
- Support for circular buffer management
- 3 event flags (DMA half transfer, DMA transfer complete and DMA transfer error) and 1 global interrupt flag (set by logical OR of the 3 events) for each channel
- Access to Flash, Sram1, Sram2, CCM Sram3, FEMC, XSPI, CRC, SDIO, FMAC, CORDIC, APB1, APB2, ATIM, ADC, DAC

- Programmable number of data to be transferred: up to 65536
- Support burst transfers, burst length is configurable, can be set to 1/2/3/4/5/6/7/8 units.

## 2.11 Real Time Clock (RTC)

The RTC consists of continuously running counters integrated with a built-in calendar clock module that provides a perpetual calendar functionality, as well as alarm interrupts and periodic interrupt.

The key features are as follows:

- The Real-Time Clock (RTC) is an independent BCD (binary-coded decimal) timer/counter
- Software supports daylight saving time compensation
- Programmable periodic automatic wake-up timer.
- Two 32-bit registers containing hours, minutes, seconds, year, month, date, and week day
- One independent 32-bit register containing sub-seconds
- Two programmable alarms
- Two 32-bit registers containing programmed hours, minutes, seconds, year, month, date, and week day
- Two independent 32-bit registers containing programmed sub-seconds
- Digital precision calibration function
- Reference clock detection: a more precise second source clock (50 or 60 Hz) can be used to enhance the calendar precision
- Three configurable filtering and internal pull-up intrusion detection events
- Timestamp functionality
- 20 backup registers that can retain data in low-power mode
- Multiple interrupt/event wake-up sources, including alarm A, alarm B, wake-up timer, timestamp, and tamper event
- As long as the supply voltage remains in the operating range, the RTC never stops, regardless of the device status (Run mode, SLEEP mode, STOP0 mode and VBAT mode)
- The RTC provides various wake-up sources that can wake the MCU from all low-power modes (SLEEP mode, STOP0 mode, and STANDBY mode)

## 2.12 Timers and Watchdogs

The N32H482 series supports up to 3 advanced timers, 10 general timers, 2 basic timers, 2 low-power timers, as well as 1 independent watchdog timer, 1 window watchdog timer, and 1 SysTick timer.

The following table compares the functions of advanced control timer, general-purpose timer, basic timer and low-power timer:

**Table 2-1 Comparison Of Timer Functions**

Timer	Counter resolution	Counter type	Prescaler factor	Capture/compare channels	Complementary outputs
ATIM1~3	16	Up, down, up/down	Any integer between 1 and 65536	4	4
GTIM1~7	16	Up, down, up/down	Any integer between 1 and 65536	4	N
GTIM8~10	16	Up, down, up/down	Any integer between 1 and 65536	4	1

Timer	Counter resolution	Counter type	Prescaler factor	Capture/compare channels	Complementary outputs
BTIM1~2	32	Up	Any integer between 1 and 65536	0	N
LPTIM1~2	16	Up	1、2、4、8、16、32、64、128	0	N

### 2.12.1 Basic Timer (BTIM1~2)

Basic timers contain a 32-bit auto-reload counter.

Main features:

- 32-bit auto-reload up-counting counter
- 16-bit programmable prescaler (The prescaler factor can be configured with any value between 1 and 65536)
- Event that generate the interrupt/DMA is as follows:
  - Update event

### 2.12.2 General-Purpose Timer (GTIM1~7)

The general-purpose timers (GTIM1/GTIM2/GTIM3/GTIM4/GTIM5/GTIM6/GTIM7) is mainly used in the following occasions: counting the input signal, measuring the pulse width of the input signal and generating the output waveform, etc.

Main features:

- 16-bit auto-reload counters (It can realize up-counting, down-counting, up/down counting)
- 16-bit programmable prescaler (The prescaler factor can be configured with any value between 1 and 65536)
- GTIMx supports up to 4 channels
- Channel's working modes: PWM output, output compare, one-pulse mode output, input capture
- The events that generate the interrupt/DMA are as follows:
  - Update event
  - Trigger event
  - Input capture
  - Output compare
- Timer can be controlled by external signal
- Timers can be linked together internally for timer synchronization or chaining
- Incremental (quadrature) encoder interface: used for tracking motion and resolving rotation direction and position
- Hall sensor interface: used to do three-phase motor control

### 2.12.3 General-Purpose Timer (GTIM8~10)

The general-purpose timers (GTIMx) is mainly used in the following occasions: counting the input signal, measuring the pulse width of the input signal and generating the output waveform, etc. The general-purpose timer features complementary output, dead-time insertion, and break functions. It is suitable for motor control.

Main features:

- 16-bit auto-reload counters (Supports up-counting, down-counting, up/down counting)
- 16-bit programmable prescaler (the prescaler factor can be configured with any value between 1 and 65536)
- Programmable repetition counter

- GTIMx supports up to 5 channels
- 4 capture/compare channels, operating modes include: PWM output, output compare, one-pulse mode output, input capture
- 1 break input signal supporting digital filtering, used to place the timer's output signal in a safe user-selectable configuration
- The events that generate the interrupt/DMA are as follows:
  - Update event
  - Trigger event
  - Input capture
  - Output compare
  - Break input
- Complementary outputs with programmable dead-time
  - For GTIMx, channel 1 support this feature
- Timer can be controlled by external signal
- Timers can be linked together internally for timer synchronization or chaining
- Incremental (quadrature) encoder interface: used for tracking motion and resolving rotation direction and position
- Hall sensor interface: used to do three-phase motor control
- Trigger input as an external clock or for per-cycle current management

#### 2.12.4 Advanced Control Timer (ATIM1~3)

The advanced control timers (TIM1 and TIM8) is mainly used for the following purposes: counting the input signal, measuring the pulse width of the input signal and generating the output waveform, etc. Advanced timers have complementary output function with dead-time insertion and bracking functionality, making it suitable for motor control.

Main features:

- 16-bit auto-reload counters. (It can realize up-counting, down-counting, up/down counting)
- 16-bit programmable prescaler. (The prescaler factor can be configured with any value between 1 and 65536)
- Programmable Repetition Counter
- ATIMx supports up to 9 channels
- 4 capture/compare channels for:
  - PWM output
  - Output compare
  - One-pulse mode output
  - Input capture
- 2 break input signals supporting digital filtering
- The events that generate the interrupt/DMA are as follows:
  - Update event
  - Trigger event
  - Input capture

- Output compare
- Break input
- Complementary outputs with programmable dead-time
  - For ATIMx, channel 1,2,3,4 support this feature
- Timer can be controlled by external signal
- Timers can be linked together internally for timer synchronization or chaining
- Incremental (quadrature) encoder interface: used for tracking motion and resolving rotation direction and position
- Hall sensor interface: used to do three-phase motor control
- Trigger input as an external clock or for per-cycle current management

## 2.12.5 Low Power Timer (LPTIM1~2)

The LPTIM is a 16-bit timer with multiple clock sources, it can keep running in all power modes. LPTIM can run without internal clock source as a “Pulse Counter”. Also, the LPTIM can wake up the system from low-power modes, to realize “Timeout functions” with extremely low power consumption.

Main features:

- 16-bit up counter
- 3-bit prescaler with 8 possible dividing factors (1,2,4,8,16,32,64,128)
- Multiple clock sources:
  - Internal clock source: LSE, LSI, HSI, HSE or APB1 clock
  - External clock source: External clock source through LPTIM Input1 (operating without LP oscillator, for Pulse Counter application)
- 16-bit auto-load register (LPTIM\_ARR)
- 16-bit compare register (LPTIM\_COMP)
- Continuous or one-shot mode counting mode
- Programmable software or hardware input trigger
- Programmable digital filter for glitch filtering
- Configurable output (PWM)
- Configurable IO polarity
- Encoder mode
- Pulse counting mode, support single pulse counting, double pulse counting (quadrature and non-quadrature)

## 2.12.6 SysTick Timer (SysTick)

This timer is dedicated to real-time operating systems and can also be used as a standard down-counter.

Main features:

- 24 bit down-counter
- Automatic reload function
- A maskable system interrupt is generated when the counter reaches 0
- Programmable clock source

## 2.12.7 Watchdog (WDG)

Built-in Independent Watchdog (IWDG) and Window Watchdog (WWDG) timers are used to detect issues caused by software errors. The watchdog timers are highly flexible, enhancing system security and the accuracy of timing control.

### Independent watchdog (IWDG)

The Independent Watchdog (IWDG) is driven by the low-speed internal clock (LSI clock) running at 32 kHz. It can continue to operate in the event of a deadlock or MCU freeze. This provides a higher level of security, timing accuracy, and watchdog flexibility. It can resolve system failures caused by software faults through a reset. The IWDG is best suited for applications where the watchdog needs to run as a completely independent process outside the main application but with lower timing accuracy constraints.

When the power control register PWR\_CTRL2.IWDGRSTEN is set to '1', a system reset occurs when the IWDG counter reaches 0 (if this is set to '0', the IWDG counts but does not trigger a reset).

Main features:

- Independent 12-bit down-counter
- The RC oscillator provides an independent clock source that can operate in SLEEP, STOP0, and STANDBY modes
- Support reset and low-power wake-up
- When the down-counter reaches 0x000, the system resets (if the watchdog is activated)

### Window watchdog (WWDG)

The clock of the Window Watchdog (WWDG) is derived by dividing the APB1 clock frequency by 4096. It detects abnormal program execution through the configuration of the time window. Therefore, WWDG is suitable for precise timing and is commonly used to monitor software faults that cause the application program to deviate from its normal operation sequence due to external interference or unforeseen logical conditions. When the WWDG decrementing counter is refreshed before reaching the window register value or after the WWDG\_CTRL.T6 bit becomes 0, a system reset occurs.

Main features:

- Programmable 14-bit independent down counter
- When the WWDG is enabled, a reset will occur under the following conditions:
  - The down-counter is less than 0x40
  - When the down counter value is greater than the value of the window register, reload will occur
- Early wake-up interrupt (EWI): triggered (if enabled and the watchdog activated) when the down-counter is equal to 0x40

## 2.13 I<sup>2</sup>C Bus Interface

The I<sup>2</sup>C (Inter-Integrated Circuit) bus is a widely used bus structure that consists of only two bidirectional lines, namely the data line SDA and the clock line SCL. Through these two lines, all devices compatible with the I<sup>2</sup>C bus can directly communicate with each other via the I<sup>2</sup>C bus.

The I<sup>2</sup>C interface connects the microcontroller and the serial I<sup>2</sup>C bus, and can be used for communication between the MCU and external I<sup>2</sup>C devices. The I<sup>2</sup>C interface module implements the standard speed mode and fast mode of the I<sup>2</sup>C protocol, with CRC calculation and verification functions, supports SMBus (System Management Bus) and PMBus (Power Management Bus). It controls all I<sup>2</sup>C bus-specific sequencing, protocol, arbitration and timing. The I<sup>2</sup>C interface module also supports DMA mode to effectively reduce the burden on the CPU.

Main features:

- This module can be used as master device or slave device
- Support 7-bit/10-bit addressing and general call

- As an I<sup>2</sup>C master device, it can generate clock, start signal, and stop signal
- As an I<sup>2</sup>C slave device, it has programmable I<sup>2</sup>C address detection and stop bit detection functions
- Support Standard-mode (up to 100 kHz), Fast-mode (up to 400 kHz) and Fast-mode Plus (up to 1MHz)
- Supports interrupt vector, transfer complete interrupt, and error event interrupt
- Optional extend clock function
- Support DMA
- Generation or verification of configurable PEC(Packet error checking)
- Compatible with the PMBus and SMBus 2.0
- Support FIFO

## 2.14 Universal Synchronous/Asynchronous Transceiver (USART)

Universal Synchronous Asynchronous Receiver Transmitter (USART) is a full-duplex serial data exchange interface that supports synchronous or asynchronous communication. It can be flexibly configured to facilitate full-duplex data exchange with a variety of external devices.

The USART interface allows configurable transmission and reception baud rates, and also supports continuous communication through DMA. USART also supports multiprocessor communication, LIN mode, synchronous mode, single-wire half-duplex communication, smart card asynchronous protocol, IrDA SIR ENDEC function, as well as hardware flow control function.

Main features:

- Full duplex, asynchronous communication
- Single-wire half-duplex communications
- Programmable baud rate, up to 15 Mbit/s
- Configurable oversampling method by 16 or 8
- Programmable data word length (8 or 9 bits)
- Two internal FIFOs for transmit and receive data
- Configurable stop bits (1 or 2 stop bits)
- Support hardware-generated parity bit and parity bit checking
- Support hardware flow control: RTS, CTS
- Support transmission and reception via DMA
- Multiprocessor communications: If the address does not match, it enters mute mode. Wake-up from mute mode by idle line detection or address mark detection
- Support synchronous mode, allowing the user to control bidirectional synchronous serial communication in master mode
- Support asynchronous Smartcard protocol, compliant with ISO7816-3 standard
- Support IrDA (infrared data association) SIR ENDEC specifications, providing both normal and low power operation modes
- Support LIN mode
- Four error detection flags:Overflow error,Noise error,Frame error,Parity error
- Support multiple interrupt requests:Transmit data register empty,CTS flag,Transmission complete,Reception complete,Data overflow,Bus idle,Parity error,LIN mode break frame detection, and noise flags/overflow errors/frame errors in multi-buffer communications

Mode configuration:

USART modes	USART1	USART2	USART3	USART4	UART5	UART6	UART7	UART8
Asynchronous mode	Y	Y	Y	Y	Y	Y	Y	Y
Multiprocessor communication	Y	Y	Y	Y	Y	Y	Y	Y
LIN	Y	Y	Y	Y	Y	Y	Y	Y
Synchronous mode	Y	Y	Y	Y	N	N	N	N
Half duplex (Single wire mode)	Y	Y	Y	Y	Y	Y	Y	Y
Smartcard mode	Y	Y	Y	Y	N	N	N	N
IrDA	Y	Y	Y	Y	Y	Y	Y	Y
DMA	Y	Y	Y	Y	Y	Y	Y	Y
Hardware flow control	Y	Y	Y	Y	Y	Y	Y	Y

Note: Y = supported; N = not supported.

## 2.15 Controller area network (FDCAN)

The N32H482 provides 2 FDCAN controllers that comply with ISO 11898-1:2015 standard, supporting CAN 2.0A/B and CAN FD protocols, and are compatible with Bosch non-ISO standard protocols.

All FDCAN modules share a message RAM area for receiving message filters, receiving FIFOs, receive buffers, transmit buffers, and transmit event FIFOs. The message RAM is located in the MCU's internal SRAM, with a configurable starting address and a maximum allocation of 4480 words (32-bit).

Main features:

- Complies with ISO 11898-1:2015 and ISO 11898-4 standards
- Support CANFD, data size up to 64 byte
- Support CAN error log record
- Support AUTOSRA standard
- Support SAE J1939 standard
- Enhanced receive filter
- Two configurable receive FIFOs
- Separate signal indication when receiving high-priority messages
- Up to 64 dedicated receive buffers
- Up to 32 dedicated transmit buffers
- Configurable transmit FIFO or queue
- Configurable transmit event FIFO
- Support configurable message RAM shared by all FDCAN controllers
- Programmable loopback test mode
- Maskable module interrupt
- Two clock domains: CAN core clock and APB bus clock
- Support power-down mode

## 2.16 Serial Peripheral Interface/inter-integrated sound interfaces (SPI/I<sup>2</sup>S)

The SPI protocol supports half-duplex, full-duplex and synchronous, serial communication with external devices. The interface can be configured as master or slave and can operate in multi-slave or multi-master configurations. The device configured as master provides communication clock (SCK) to the slave device. It can be used for a variety of

purposes, including simplex synchronous transfers on two lines with bidirectional data line, and also support hardware CRC check.

I<sup>2</sup>S is also a synchronous serial interface communication protocol. It supports four audio standards, including the Philips I<sup>2</sup>S standard, MSB and LSB alignment standards, and PCM standards. In half-duplex communication, it can operate in two modes: master and slave. When operating as a master device, it can provide clock signals to external slave devices via the interface.

The SPI main features are:

- Full-duplex and simplex synchronous transmission
- Support master, slave and multi-master mode
- 8 or 16 bit transmission frame format selection
- Programmable data order
- Hardware or software management of chip select signal
- Programmable clock polarity and phase
- Support hardware CRC calculation and check
- Support DMA transfer
- 8 bytes transmit/receive FIFO

The I<sup>2</sup>S main features are:

- Full-duplex and half-duplex synchronous transmission
- Support master, slave mode
- Supported I<sup>2</sup>S protocols:
  - I2S Philips standard
  - MSB-Justified standard (Left-Justified)
  - LSB-Justified standard (Right-Justified)
  - PCM standard (with short and long frame synchronization)
- Configurable audio sampling frequency, ranging from 8KHz to 192KHz
- Programmable clock polarity (steady state)
- Data order is always MSB first
- Support DMA transfer
- Support multiple clock sources

## 2.17 Expanded Serial Peripheral Interface(xSPI)

xSPI is an interface used for communication with single/dual/quad/octal line SPI peripherals. It can operate in two modes: indirect and memory-mapped mode.

It supports indirect mode: all operations are performed using xSPI registers; memory-mapped mode: the external Flash is memory mapped and is seen by the system as if it were an internal memory.

Main features:

- Configurable for 1/2/4/8-bit data
- Support Single SPI/Normal SPI、DUAL SPI、QUAD SPI、Dual-QUAD、OCTAL SPI modes
- Support Motorola SPI:
  - Standard/Dual/Quad/Octal SPI

- Support SDR and DDR modes
- Support DDR transfer data mask
- Support clock stretching
- In indirect mode and memory-mapped mode, frame format and operation codes can be software configured
- Integrated FIFO for reception and transmission
- 8/16/32-bit data accesses allowed
- 16 words TX FIFO and 16 words RX FIFO
- Support DMA transfer
- XIP mode supports SPI read and write, and supports serial NOR FLASH
  - Support continuous transfer mode
  - Support data prefetch
- Support automatic decryption of executed code, meaning that the xSPI peripheral stores encrypted code, reads the encrypted code during execution, and decrypts it to plaintext for CPU execution, without affecting the access speed to the peripheral storage. The decryption can be software configurable to enable/disable, and the root key is stored in the NVR area, inaccessible to the user
- Support serial NAND FLASH and PSRAM
- When xSPI accesses external memory for read and write, after xSPI initialization, there is no need for additional configuration of xSPI between writing to and reading from external storage, allowing direct memory access (via SRAM address) for reading and writing to external memory
- Support 2 external chip select output controls in master mode; Support 1 chip select input in slave mode. All IOs multiplexed as chip select outputs in master mode can be multiplexed as chip select inputs in slave mode
- Support multi-master arbitration function

## 2.18 Flexible External Memory Controller (FEMC)

The Flexible External Memory Controller (FEMC) is used to access various external memories, enabling easy expansion of different types of high-capacity static memories according to application needs. It can simultaneously expand multiple types of static memories without increasing external interfaces. All external memories share the address, data, and control signals output by the FEMC controller, and FEMC distinguishes different external devices through a unique chip select signal.

Main features:

- Support the following devices:
  - SRAM
  - PSRAM
  - ROM
  - NOR Flash
  - NAND Flash (SLC)
  - LCD (8080/6800)
- Support two NAND flash blocks, hardware 1-bit ECC can detect up to 8K bytes of data
- Burst mode support for faster access to synchronous devices, such as NOR flash and PSRAM
- 8/16-bit data bus width
- Independent chip select control for each memory bank

- Support various different devices through timing programming
- Based on the data width of the external memory, it automatically converts 32-bit AHB access requests into consecutive 16-bit or 8-bit accesses, enabling communication with external 16-bit or 8-bit memory devices. It converts 32-bit AHB access requests into consecutive 16-bit or 8-bit accesses for accessing external 16-bit or 8-bit devices
- Write enable and byte lane select outputs for use with PSRAM and SRAM devices

## 2.19 Secure Digital Input and Output Interface (SDIO)

The SDIO interface defines the host interface for SD cards, SD I/O cards, and MultiMediaCards (MMC). It provides data transfer between the AHB peripheral bus and MMC, SD storage cards, and SDIO cards. The MultiMediaCard system specifications are available through the MultiMediaCard Association website at [www.mmca.org](http://www.mmca.org), published by the MMCA technical committee. SD memory card and SD I/O card system specifications are available through the SD card Association website at [www.sdcard.org](http://www.sdcard.org).

Main features:

- SD card: fully compatible with SD card specification version 2.0
- SD I/O: fully compatible with SD I/O card specification version 2.0, support two different data bus modes: 1-bit (default) and 4-bit
- MMC: fully compatible with MultiMediaCard system specification version 4.2 and earlier versions. Support three different data bus modes: 1-bit (default), 4-bit, and 8-bit
- Achieves a data transfer rate of up to 50MHz in 8-bit data bus mode
- Support interrupts and DMA requests
- Data and command output enable signals used to control external bidirectional drivers

Notes:

(1) SDIO is not compatible with SPI communication mode.

(2) In the MultiMediaCard system specification version 2.11, it is defined that the SD storage card protocol only supports the I/O mode of the SD card or the I/O part of the composite card. It does not support many commands required in SD storage devices, such as erase commands that do not work in SD I/O devices, so SDIO does not support these commands. Additionally, some commands in SD storage cards and SD I/O cards are different, and SDIO does not support these commands.

SDIO supports only one SD/SDIO/MMC 4.2 card at a time, but can support multiple MMC version 4.1 or earlier cards.

## 2.20 Universal Serial Bus Full-Speed Device Interface (USB\_FS\_Device)

The Universal Serial Bus Full-Speed Device Interface (USB\_FS\_Device) module is a peripheral that complies with the USB 2.0 Full-Speed protocol. It includes the physical layer USB PHY and does not require an additional PHY chip. The USB\_FS\_Device supports four types of transfers defined in the USB 2.0 protocol: **control transfer**, **bulk transfer**, **interrupt transfer**, and **isochronous transfer**.

Main features:

- Comply with the technical specifications of USB2.0 full-speed equipment
- Configurable up to 8 USB endpoints
- Each endpoint supports the four types of transfer defined in the USB 2.0 protocol:
  - control transfer
  - bulk transfer
  - interrupt transfer

- synchronous transfer
- Double buffer mechanism for bulk/isochronous endpoints
- Cyclic redundancy check (CRC) generation/checking, Non-return-to-zero Inverted (NRZI) encoding/decoding and bit-stuffing
- Support USB Suspend/Resume operation
- Frame locked clock pulse generation

## **2.21 Universal Serial Bus High-Speed DualRole Interface (USB\_HS\_DualRole)**

USB High-Speed Dual Role Interface (USB HS Dual Role), hereinafter referred to as USBHS. The USBHS controller is designed to provide a standard interface for high-speed data transfer and connecting external devices. USBHS supports both host and device modes, it contains a full-speed USB PHY internal, which can be configured as high-speed or full-speed mode, no more external PHY chip is needed. It supports all the four types of transfer (control, bulk, Interrupt and isochronous) defined in USB 2.0 protocol. There is also a DMA engine operating as an AHB bus master in USBHS to speed up the data transfer between USBHS and system.

Main features:

- Support USB 2.0 high-speed (480Mb/s) / full-speed (12Mb/s) / low-speed (1.5Mb/s) Host mode
- Support USB 2.0 high-speed (480Mb/s) / full-speed (12Mb/s) Device mode
- Support all the four types of transfer: control transfer, bulk transfer, interrupt transfer and isochronous transfer
- USBHS contains a full-speed USB PHY internal, which supports high-speed, full-speed and low-speed operation, no more external PHY chip is needed
- Support HS SOF, FS SOF, and LS Keep-alive tokens
- SOF pulse can be output through PAD
- SOF pulse is connected internally to the timer (TIMx)
- Support A-B device identification (ID line)
- USBHS has embedded DMA, and can be software configured for AHB bulk transfer type
- Has power-saving functions, such as stopping the system during USB suspension, shutting down digital module clocks, and managing power for PHY and DFIFO
- 4 KB dedicated RAM
- Contain 16 host channels in Host mode, each channel supports any type of USB transfer
- Built-in hardware scheduler in Host mode:
  - Up to 16 interrupt and synchronous transfer requests in the periodic hardware queue
  - Up to 16 control and bulk transfer requests in the non-periodic hardware queue
- In Host mode, it contains one RX FIFO, one periodic transfer TX FIFO, and one non-periodic transfer TX FIFO
- In Device mode, it contains 1 bidirectional control endpoint 0, as well as 8 IN endpoints and 7 OUT endpoints. IN and OUT endpoints can be configured for bulk transfer, interrupt transfer, or isochronous transfer
- In Device mode, it contains a shared RX FIFO and a TX-OUT FIFO, as well as 9 dedicated TX-IN FIFOs
- Supports soft disconnect function

*Note: The USBHS requires a 16MHz external crystal as a clock source when using high speed mode.*

## 2.22 Filter Math Accelerator (FMAC)

The FMAC performs arithmetic operations on vectors. It comprises a multiplier/accumulator (MAC) unit, together with address generation logic that allows it to index vector elements held in local memory. The unit includes support for circular buffers on input and output, that allows digital filters to be implemented. Both finite and infinite impulse response filters can be done.

The unit allows frequent or lengthy filtering operations to be offloaded from the CPU, freeing up the processor for other tasks. In many cases it can accelerate such calculations compared to a software implementation, resulting in a speed-up of time critical tasks.

Main features:

- 16 x 16-bit multiplier
- 24 + 2-bit accumulator with addition and subtraction
- 16-bit input and output data
- 256 x 16-bit local memory
- Up to three areas can be defined in memory for data buffers (two input, one output), defined by programmable base address pointers and associated size registers
- Input and output buffers can be circular
- Filter functions: FIR, IIR (direct form 1)
- Vector functions: dot product, convolution, correlation
- DMA read and write data channels

## 2.23 CORDIC Co-processor (CORDIC)

The CORDIC co-processor provides hardware acceleration of certain mathematical functions, notably trigonometric, commonly used in motor control, metering, signal processing and many other applications.

Main features:

- Support rotation and vectoring calculation modes
- Support circular and hyperbolic modes
- Once the calculation starts, any operation to read the result register will insert the bus into a waiting state until the calculation is completed. Therefore, the calculation result can be read out when it is completed without the need for polling or interrupts
- Support 10 functions: sine, cosine, sinh, cosh, atan, atan2, atanh, modulus, square root, natural logarithm
- Support fixed-point and floating-point input/output modes
- Support interrupt, polling, and DMA request read/write modes
- Programmable precision

## 2.24 General-Purpose Input/Output Interface (GPIO)

Up to 118 GPIOs, which can be divided into eight groups (GPIOA/GPIOB/GPIOC/GPIOD/GPIOE/GPIOF/GPIOG/GPIOH). GPIO ports share pins with other multiplexed peripherals, allowing users to configure them flexibly according to requirements. Each GPIO pin can be configured by software as an output (push pull or open drain), input (with or without pull-up or pull-down), or alternate peripheral function port. All GPIO pins have high current

passing capability except ports with analog input capability.

Main features:

- Each bit of the GPIO port can be configured separately by the software into multiple modes:
  - Input floating
  - Input pull up
  - Input pull down
  - Analog function
  - Open-drain output, pull-up and pull-down configurable
  - Push-pull output, pull-up and pull-down configurable
  - Push-pull alternate function, pull-up and pull-down configurable
  - Open-drain alternate function, pull-up and pull-down configurable
- Independent bit set or set functions
- All I/O support external interrupts
- All I/O support low-power mode wake-up, with configurable rising or falling edge:
  - 16 EXTI lines can be used for STOP0 mode wake-up, and all I/O can be multiplexed as EXTI
  - PA0/PA2/PC5/PC13/PE6 can be used to wake-up from STANDBY mode
- Support software configure alternate function selection
- Support GPIO lock mechanism, can only be cleared by reset once locked

Each I/O port bit can be programmed arbitrarily, but the I/O port register must be accessed in 32-bit words (16-bit half-word or 8-bit byte access is not allowed).

## 2.25 Analog/Digital Converter (ADC)

12 bit ADC consists of a 12-bit successive approximation high-speed analog-to-digital converter. There are four ADCs, ADC1/ADC2, ADC3/ADC4 that can be combined into dual ADCs mode; ADC1/ADC2/ADC3 can be combined into triple ADCs mode. Each ADC has up to 19 multiplexed channels. A/D conversion of the various channels can be performed in single, continuous, scan or discontinuous mode. The result of the ADC is stored in a left-aligned or right-aligned 16-bit data register. The analog watchdog1/2/3 feature allow the application to detect if the input voltage goes outside the user-defined high or low thresholds, and the frequency of ADC input clock is up to 80 MHz.

Main features:

- Support 4 ADCs, support single-ended or differential inputs
  - ADC1 is connected to 16 external channels and to 3 internal channels
  - ADC2 is connected to 18 external channels and to 1 internal channels
  - ADC3 is connected to 19 external channels
  - ADC4 is connected to 19 external channels
- Support 12/10/8/6-bits resolution configurable
  - The maximum sampling rate at 12bit resolution is 4.7 MSPS
  - The maximum sampling rate at 10bit resolution is 6 MSPS
  - The maximum sampling rate at 8bit resolution is 7.2 MSPS

- The maximum sampling rate at 6bit resolution is 9 MSPS
- ADC clock source is divided into working clock source, sampling clock source and timing clock source
  - AHB\_CLK can be configured as the working clock source, up to 240 MHz
  - PLL can be configured as a sampling clock source, up to 80 MHZ, support 1, 2, 3, 4, 6, 8, 10, 12 frequency division
  - The AHB\_CLK can be configured as the sampling clock source, up to 80 MHz, and supports frequency 1, 2, 3, 4, 6, 8, 10, 12, 16, 32
  - The timing clock is used for internal timing functions and the frequency must be configured to 1MHz
- Supports EXTI/TIMER trigger ADC sampling
- The sampling time interval for all channels can be programmed independently
- 3 analog watchdogs per ADC
- When the ADC is ready, sampling is completed, conversion is finished, or an analog watchdog 1/2/3 event occurs, an interrupt can be triggered
- Support 4 conversion modes:
  - Single conversion
  - Continuous conversion
  - Discontinuous mode
  - Scan mode
- Support self-calibration
- Data alignment with in-built data coherency
- Start-of-conversion can be initiated:
  - By software for both regular and injected conversions
  - By hardware triggers with configurable polarity (internal timers events or GPIO input events) for both regular and injected conversions
- Oversampling
  - 16-bit data register
  - Adjustable oversampling ratio, x2, x4, x8, x16, x32, x64, x128, x256
  - Programmable data right shift up to 8 bits
- Data preconditioning
  - Support offset compensation
  - Support gain compensation
- Multi-ADC mode
  - Dual ADC mode: ADC1 and ADC2 combined, ADC3 and ADC4 combined
  - Triple ADC mode: ADC1, ADC2, and ADC3 combined
- ADC power supply requirements: 1.8V to 3.6V
- ADC input range:  $V_{REF-} \leq V_{IN} \leq V_{REF+}$

## 2.26 Digital/Analog Converter (DAC)

DAC is Digital-to-Analog Converter, which primarily involves digital input and voltage output. The DAC can be configured in 8-bit or 12-bit mode and may be used in conjunction with the DMA controller. In 12-bit mode, the data can be left or right-aligned. In 8-bit mode, the data can be right-aligned. Each DAC has its own converter and can perform conversions independently. In dual DAC mode, conversions can be done independently or simultaneously when both DACs are grouped (DAC1 & DAC2) together for synchronous update operations.

When the DAC output is internally connected to peripherals on the chip, the DACx\_OUT pin can be used as a general-purpose input/output (GPIO). The DAC output buffer can be selectively enabled to obtain a high-drive output current.

Main features:

- Support 2 DACs, each DAC has its own converter
- An output channel for a built-in Buffer
- Configurable 8/12-bits output, configurable left or right data alignment in 12-bit mode
- Dual DAC channel for independent or simultaneous conversions
- DMA capability for each channel including DMA underrun error detection
- Double data DMA capability to reduce the bus activity
- Noise-wave, Triangular-wave and Saw tooth wave generation
- DAC output supports connection to on-chip peripherals
- Buffer offset calibration
- Input voltage reference from V<sub>REF+</sub>
- External triggers for conversion

## 2.27 Cyclic Redundancy Check Calculation Unit (CRC)

The device integrates CRC32 and CRC16 functionalities. The cyclic redundancy check (CRC) calculation unit is based on a fixed generation polynomial to obtain arbitrary CRC calculation results. In many applications, CRC-based techniques are used to verify data transfer or storage consistency. Within the scope of the EN/IEC 60335-1 standard, it provides a means of detecting flash memory errors. The CRC unit can be used to calculate signatures of software in real time and compare them with signatures generated during the link-time and generating of the software.

Main features of CRC32:

- CRC32 ( $X^{32} + X^{26} + X^{23} + X^{22} + X^{16} + X^{12} + X^{11} + X^{10} + X^8 + X^7 + X^5 + X^4 + X^2 + X + 1$ )
- 32-bit data to be checked and 32-bit output checksum
- CRC32 calculation time: 1 AHB clock cycles (HCLK)
- General-purpose 8-bit register
- Programmable CRC initial value

Main features of CRC16:

- CRC16 ( $X^{16} + X^{15} + X^2 + 1$ )
- 8-bit data to be checked and 16-bit output checksum
- CRC16 calculation time: 1 AHB clock cycles (HCLK)
- Configurable check initial value, and configurable endianness of the data to be checked
- Support 8-bit LRC checksum value generation

- Programmable CRC initial value

## 2.28 Secure Algorithm Co-processor (SAC)

The device features a secure algorithm co-processor, it supports a variety of international algorithms hash cryptography algorithm acceleration, which can greatly improve the speed of encryption and decryption compared with pure software algorithm.

The hardware supports the following algorithms:

- Support DES symmetric algorithms
  - DES and 3DES encryption and decryption operations are supported
  - TDES supports 2KEY and 3KEY mode
  - Support CBC and ECB mode
- Support the symmetric AES algorithm
  - Support 128bits, 192bits, or 256bits key length
  - Support CBC, ECB, and CTR mode
- Support the symmetric SM4 algorithm
  - Support CBC, ECB mode
- Support SHA hash algorithm
  - Support SHA1, SHA244, SHA256
- Support the MD5 digest algorithm
- Support SM3 hash algorithm
- Support random number generation

## 2.29 Unique Device Serial Number (UID)

The N32H482 series products have two built-in unique device serial numbers of different lengths, which are 96-bit unique device ID (UID) and 128-bit unique customer ID (UCID). These two device serial numbers are stored in the system configuration block of Flash memory. The information they contain is written at the time of delivery and is guaranteed to be unique to any of the N32H482 series microcontrollers under any circumstances and can be read by user applications or external devices through the CPU or JTAG/SWD interface and cannot be modified.

The 96-bit UID is usually used as a serial number or password. When writing Flash memory, this unique identifier is combined with software encryption and decryption algorithm to further improve the security of code in Flash memory. It can also be used to activate Secure Bootloader with security functions.

The UCID is 128-bit, which complies with the definition of Nations technology chip serial number. It contains the information related to chip production and version.

## 2.30 Serial Single-Wire JTAG Debug Port (SWJ-DP)

The device has an embedded ARM SWJ-DP interface, which is a combination of JTAG and serial single-wire debugging interface, can achieve serial single-line debugging interface or JTAG interface connection. The JTMS and JTCK signals of JTAG share pins with SWDIO and SWCLK respectively, and a special signal sequence on the JTMS pin is used to switch between JTAG-DP and SW-DP.

Notes:

1.  $I$  = input,  $O$  = output,  $S$  = power supply.
2. FT: 5V tolerant; FTa: 5V tolerant, support analog peripherals.
3. Fail-safe indicates that when the chip has no power input, a high input level is added to the IO. The high input level does not flood into the chip, resulting in a certain voltage on the power supply and current consumption.
4. The RTS\_DE, TX, and RX signals of USART3, UART5 and UART8 can be mapped to any IO.
5. The TX, and RX signals of FDCAN1 and FDCAN2 can be mapped to any IO.

The ADC12\_INx mentioned in the pin name annotations in the table indicates that this pin can be either ADC1\_INx or ADC2\_INx. For example, ADC12\_IN9 means that this pin can be configured as ADC1\_IN9 or ADC2\_IN9.

Similarly, the ADC34\_INx mentioned in the pin name annotations in the table indicates that this pin can be either ADC3\_INx or ADC4\_INx.

In the pin PA0 of the table, the multiplexing function GTIM1\_CH1\_ETR means that this function can be configured as GTIM1\_TII or GTIM1\_ETR. Similarly, for PA15, the remapping multiplexing function name GTIM1\_CH1\_ETR has the same meaning.

For the FT ports in the table, it is necessary to ensure that the voltage difference between the IO voltage and the power supply voltage is less than 3.6V.

## 4 Electrical Characteristics

### 4.1 Parameter Conditions

All voltages are based on V<sub>SS</sub> unless otherwise specified.

#### 4.1.1 Minimum and Maximum Values

The minimum and maximum values in the Beta version are based on design simulations.

Note at the bottom of each form that data obtained through comprehensive evaluation, design simulation and/or process characteristics will not be tested on the production; Base on comprehensive evaluation, the minimum and maximum values are obtained by taking the average of the samples tested and adding or subtracting three times the standard distribution (mean  $\pm 3\sigma$ ).

#### 4.1.2 Typical Values

Unless otherwise specified, typical data are based on T<sub>A</sub> = 25 °C and V<sub>DD</sub> = 3.3V (for the 1.8V ≤ V<sub>DD</sub> ≤ 3.6V voltage range). These data are for design guidance only and not tested.

#### 4.1.3 Typical Curves

Unless otherwise specified, typical curves are for design guidance only and not tested.

#### 4.1.4 Loading Capacitor

The load conditions for measuring pin parameters are shown Figure 4-1:

Figure 4-1 Load Conditions Of Pins

#### 4.1.5 Pin Input Voltage

The measurement of the input voltage on the pin is shown Figure 4-2:

**Figure 4-2 Pin Input Voltage**

## 4.1.6 Power Supply Scheme

Figure 4-3 Power Supply Scheme

Note:

- (1) The  $4.7\mu F$  capacitor in the above diagram must be connected to the specified VDD. The specified VDD for LQFP64 is Pin 64, for LQFP100 is Pin 100, and for LQFP144 is Pin 144.

#### 4.1.7 Current Consumption Measurement

Figure 4-4 Current Consumption Measurement Scheme

#### 4.2 Absolute Maximum Rating

The load applied to the device may permanently damage the device if it exceeds the values given in the Absolute maximum rating list (Table 4-1, Table 4-2, Table 4-3). The maximum load that can be sustained is only given here, and it does not mean that the functional operation of the device under such conditions is correct. The reliability of the device will be affected when the device works for a long time under the maximum condition.

Table 4-1 Voltage Characteristics

Symbol	Describe	Min	Max	Unit
V <sub>DD</sub> - V <sub>SS</sub>	External main supply voltage (including V <sub>DPA</sub> and V <sub>DD</sub> ) <sup>(1)</sup>	-0.3	4.0	V
V <sub>IN</sub>	Input voltage on 5V tolerant pins <sup>(3)</sup>	V <sub>SS</sub> - 0.3	5.5	
	Input voltage on other pins <sup>(2)</sup>	V <sub>SS</sub> - 0.3	V <sub>DD</sub> + 0.3	
Δ V <sub>DDx</sub>	Voltage difference between different supply pins	-	50	mV
V <sub>SSx</sub> - V <sub>SS</sub>	Voltage difference between different ground pins	-	50	
V <sub>ESD(HBM)</sub>	ESD Electrostatic discharge voltage (human body model)	See section 4.3.11		-

Notes:

- (1) All power (V<sub>DD</sub>, V<sub>DPA</sub>) and ground (V<sub>SS</sub>, V<sub>SSA</sub>) pins must always be connected to the external power supply system within permissible limits.
- (2) V<sub>IN</sub> shall not exceed its maximum value. Refer to Table 4-2 for current characteristics.
- (3) When a 5V tolerant pin inputs 5.5V, V<sub>DD</sub> cannot be lower than 2.25V.

I <sub>INJ(PIN)</sub> <sup>(2)(3)</sup>	Output current source by I/O and control pins	-12	
	Injection current on NRST pin	-5/0	
	Injection current on other pins	+/-5	

*Notes:*

- (1) All power ( $V_{DD}$ ,  $V_{DDA}$ ) and ground ( $V_{SS}$ ,  $V_{SSA}$ ) pins must always be connected to the external power supply system within permissible limits.
- (2) When  $V_{IN} > V_{DD}$ , there is a forward injection current; when  $V_{IN} < V_{SS}$ , there is a reverse injection current.  $I_{INJ(PIN)}$  should not exceed its maximum value. Refer to Table 4-1 for voltage characteristics.
- (3) Reverse injection current can interfere with the analog performance of the device. See section 4.3.2326.
- (4) When the maximum current occurs, the maximum allowable voltage drop of  $V_{DD}$  is 0.1V $V_{DD}$ .

### 4.3.5 Power Supply Current Characteristics

The current consumption is a combination of several parameters and factors, including operating voltage, ambient temperature, load of I/O pins, software configuration of the product, operating frequency, toggle rate of I/O pins, program location in memory, and executed code.

The measurement method of current consumption is described in Figure 4-4.

All of the current consumption measurements given in this section are while executing a reduced set of code.

#### 4.3.5.1 Maximum Current Consumption

The device is under the following conditions:

- All I/O pins are in input mode and are connected to a static level -- V<sub>DD</sub> or V<sub>SS</sub> (no load).
- All peripherals are disabled except otherwise noted.
- The access time of the flash memory is adjusted to the fastest operating frequency (0 waiting period from 0 to 40 MHz, 1 waiting period from 40 to 80 MHz, 2 waiting periods from 80 to 120 MHz, 3 waiting periods from 120 to 160 MHz, 4 waiting periods from 160 to 200 MHz, 5 waiting periods from 200 to 240 MHz).
- Instruction prefetch is enabled (note: this parameter must be set before setting the clock and bus divider).
- When the peripheral is enable: f<sub>PCLK1</sub> = f<sub>HCLK</sub>/2, f<sub>PCLK2</sub> = f<sub>HCLK</sub>/2.
- V<sub>DD</sub> is 3.63V, ambient temperature is 105°C

The parameters given in Table 4-8 and Table 4-9 are based on tests at the ambient temperature and V<sub>DD</sub> supply voltage listed in Table 4-4.

### High-speed external clock generated using a crystal/ceramic resonator

High speed external clocks (HSE) can be generated using an oscillator consisting of a 4~32MHz crystal/ceramic resonator. The information presented in this section is based on a comprehensive feature evaluation using typical external components listed in the table below. In applications, the resonator and load capacitance must be as close to the oscillator pins as possible to reduce output distortion and stabilization time at startup. For detailed crystal resonator parameters (frequency, package, accuracy, etc.), please consult the appropriate manufacturer. (The crystal resonator mentioned here is usually referred to as passive crystal oscillator)

Table 4-15 HSE 4~32MHz Oscillator Characteristics <sup>(1)(2)</sup>

Symbol	Parameter	Conditions	Min	Typ	Max	Unit

$g_m$	Transconductance of the oscillator	Start	-	10	-	mA/V
$t_{SU(HSE)}^{(3)}$	Startup time (8M crystal)	$V_{DD}$ is stabilized	-	10	-	mA/V

Notes:

- (1) The characteristic parameters of the resonator are given by the crystal/ceramic resonator manufacturer.
- (2) Guaranteed by characterization results, not tested in production.
- (3)  $t_{SU(HSE)}$  is the start time, from the time when HSE is enabled by the software to the time when a stable 8MHz oscillation is obtained. This value is measured on a standard crystal resonator and can vary widely depending on the crystal manufacturer.

**Figure 4-7 Typical Application Using 8 MHz Crystal**

- (1) The  $R_{EXT}$  value depends on the properties of the crystal.

#### Low-speed external clock generated by a crystal/ceramic resonator

The low speed external clock (LSE) can be generated using an oscillator consisting of a 32.768 kHz crystal/ceramic resonator. The information presented in this section is based on a comprehensive feature evaluation using typical external components. In applications, the resonator and load capacitance must be as close to the oscillator pins as possible to reduce output distortion and stabilization time at startup. For detailed crystal resonator parameters (frequency, package, accuracy, etc.), please consult the appropriate manufacturer. (The crystal resonator mentioned here is usually referred to as passive crystal oscillator)

*Note: For  $C_{L1}$  and  $C_{L2}$ , it is recommended to use high quality ceramic dielectric containers, and to select crystals or resonators that meet the requirements. Usually  $C_{L1}$  and  $C_{L2}$  have the same parameters. Crystal manufacturers usually give parameters for load capacitance as serial combinations of  $C_{L1}$  and  $C_{L2}$ .*

*Load capacitance  $C_L$  is calculated by the following formula:  $C_L = C_{L1} \times C_{L2} / (C_{L1} + C_{L2}) + C_{stray}$ , where  $C_{stray}$  is the capacitance of the pin and the PCB or PCB-related capacitance.*

For example: If a resonator with load capacitance  $C_L = 6pF$  is selected and  $C_{stray} = 2pF$ , then  $C_{L1} = C_{L2} = 8pF$ .

Notes:

- (1) Guaranteed by design, not tested in production.
- (2) ts<sub>U(LSE)</sub> is the starting time, which is the period from the LSE enabled by the software to the stable 32.768 kHz oscillation. This value is measured on a standard crystal resonator and can vary widely depending on the crystal manufacturer.

(2) Guaranteed by characterization results, not tested in production.

#### 4.3.8 Wake Up Time from Low Power Mode

The wake-up time listed in **Table 4-19** is measured during the wake-up phase of an 8MHz HSI RC oscillator. The clock source used when waking up depends on the current operating mode:

- STOP0 or STANDBY mode: clock source is RC oscillator
- SLEEP mode: The clock source is the clock used to enter SLEEP mode

All times were measured using ambient temperature and supply voltage in accordance with **Table 4-4**.

**Table 4-19 Wake Time In Low Power Mode**

Symbol	Parameter	Typ <sup>(1)</sup>	Unit
twusleep	Wake up from SLEEP mode	6	Cycles
twustop0	Wake up from STOP0 mode (regulator in run mode)	20	μs
	Wake up from STOP0 mode (regulator in low power mode)	22	μs
twustdby	Wake up from STANDBY mode	100	μs

(1) The wake up time is measured from the start of the wake up event until the first instruction is read by the user program.

#### 4.3.9 PLL Characteristics

The parameters listed in **Table 4-20** are measured when the ambient temperature and power supply voltage meet the conditions in **Table 4-4**

**Table 4-20 PLL Features**

Symbol	Parameter	Value			Unit

### 4.3.11 Absolute Maximum (Electrical Sensitivity)

Based on three different tests (ESD, ES, LU), a specific measurement method is used to test the strength of the chip to determine its performance in terms of electrical sensitivity.

#### Electrostatic discharge (ESD)

Electrostatic discharge (a positive pulse followed by a negative pulse one second later) is applied to all pins of all samples.

**Table 4-24 Absolute Maximum ESD Value**

Symbol	Parameter	Condition	Type	Max <sup>(1)</sup>	Unit
$V_{ESD(HBM)}^{(2)}$	Electrostatic discharge voltage (human body model)	$T_A = +25^\circ C$ , In accordance with MIL-STD-883K Method 3015.9	3A	4000	V
$V_{ESD(CDM)}$	Electrostatic discharge voltage (charging device model)	$T_A = +25^\circ C$ , In accordance with ESDA/JEDEC JS-002-2018	C3	1000	

(1) Based on comprehensive evaluation, not tested in production.

(2) VBAT pin voltage maximum 2000V

#### Electromagnetic susceptibility (EMS)

**Table 4-25 EMS Features**

Symbol	Parameter	Condition	Level
$V_{FESD}$	Voltage limits to be applied on any I/O pin to induce a functional disturbance	$VDD = 3.3V$ , LQFP144, $T_A = 25^\circ C$ , HCLK = 240MHz, conforms to IEC 61000-4-2	4A
$V_{EFTB}$	Fast transient voltage burst limits to be applied through 100 pF on VDD and VSS pins to induce a functional disturbance	$VDD = 3.3V$ , LQFP144, $T_A = 25^\circ C$ , HCLK = 240MHz, conforms to IEC 61000-4-4	4A
	Fast transient voltage burst and capacitively coupled clamping limits to be applied on I/O pins to induce a functional disturbance	$VDD = 3.3V$ , LQFP144, $T_A = 25^\circ C$ , HCLK = 240MHz, conforms to IEC 61000-4-4	4A

#### Static latch-up (LU)

To evaluate the locking performance, two complementary static locking tests were performed on six samples:

- Supply voltage exceeding limit for each power pin.
- Current is injected into each input, output, and configurable I/O pin.

This test conforms to EIA/JESD78A IC latch standard.

**Table 4-26 Static Latch-Up**

Symbol	Parameter	Condition	Type	Max <sup>(1)</sup>
LU	Static lock-up class	$T_A = +125^\circ C$ , in accordance with JESD 78E	II class A	$\pm 200mA$ , $1.5 \times VDDMAX$

(1) Tested on normal temperature conditions.

### 4.3.12 I/O Port Characteristics

#### General input/output characteristics

Unless otherwise specified, the parameters listed in the following table are measured according to the conditions in Table 4-4. All I/O ports are CMOS and TTL compatible.

**Table 4-27 I/O Static Characteristics**

Symbol	Parameter	Condition	Min <sup>(1)</sup>	Typ <sup>(1)</sup>	Max <sup>(1)</sup>	Unit

R <sub>PD</sub>	Weak pull-down equivalent resistor <sup>(4)</sup>	VDD=3.3v, V <sub>IN</sub> = V <sub>DD</sub>	80	-	220	kΩ
		VDD=1.8~3.3v, V <sub>IN</sub> = V <sub>DD</sub>	60	-	500	kΩ
C <sub>IO</sub>	I/O pin capacitance	-	-	5	-	pF

Notes:

- (1) The hysteresis voltage of Schmitt trigger switching level. Based on comprehensive evaluation, not tested in production.
- (2) At least 100mV.
- (3) If there is reverse current injection from adjacent pins, the leakage current may be higher than the maximum value.
- (4) Pull-up and pull-down resistors are implemented with a switchable PMOS/NMOS.
- (5) V<sub>PAD</sub> refers to the input voltage of the IO pin.

All I/O ports are CMOS and TTL compatible (no software configuration required) and their features take into account most of the strict CMOS process or TTL parameters:

### Output driving current

GPIO (universal input/output port) can absorb or output up to +/-12mA current. In the user application, the number of I/O pins must ensure that the drive current does not exceed the absolute maximum ratings given in Section 4.2.

- The sum of the currents sourced by all the I/Os on V<sub>DD</sub>, plus the maximum consumption of the MCU sourced on V<sub>DD</sub>, cannot exceed the absolute maximum rating value I<sub>VDD</sub> (Table 4-2)
- The sum of the currents sourced by all the I/Os on V<sub>SS</sub>, plus the maximum consumption of the MCU sourced on V<sub>SS</sub>, cannot exceed the absolute maximum rating value I<sub>VSS</sub> (Table 4-2)

### Output voltage

Unless otherwise specified, the parameters listed in Table 4-29 were measured using ambient temperature and V<sub>DD</sub> supply voltage in accordance with Table 4-4. All I/O ports are CMOS and TTL compatible

**Table 4-28 IO Output Drive Capability Characteristics<sup>(1)</sup>**

		V <sub>DD</sub> =1.8V, I <sub>OH</sub> <sup>(4)</sup> = 2/4/8/12	0.8*V <sub>DD</sub>	V <sub>DD</sub>	

Notes:

- (1) The current I<sub>IO</sub> absorbed by the chip must always follow the absolute maximum rating given in Table 4-2, and the sum of I<sub>IO</sub> (all I/O pins and control pins) must not exceed I<sub>VSS</sub>.
- (2) The current I<sub>IO</sub> output from the chip must always follow the absolute maximum rating given in Table 4-2, and the sum of I<sub>IO</sub> (all I/O pins and control pins) must not exceed I<sub>VDD</sub>.
- (3) Data based on characterization results, not tested in production
- (4) Actual drive capability see Table 4-28.
- (5) PC13, PC14, PC15 are not within this range.

### Input/output AC characteristics

The definitions and values of the input and output AC characteristics are given in **Figure 4-9** and **Table 4-30** respectively.

Unless otherwise specified, the parameters listed in **Table 4-30** were measured using ambient temperature and supply voltage in accordance with **Table 4-4**.

### 4.3.13 NRST Pin Characteristics

The NRST pin input driver uses the CMOS process, which is connected to an unbreakable pull-up resistor,  $R_{PU}$  (see **Table 4-31**). Unless otherwise specified, the parameters listed in **Table 4-31** were measured using ambient temperature and supply voltage in accordance with **Table 4-4**.

**Table 4-31 NRST Pin Characteristics**

Symbol	Parameter	Condition	Min	Typ	Max	Unit
$V_{IL(NRST)}^{(1)}$	NRST input low level voltage	-	$V_{SS}$	-	$0.3*V_{DD}$	V
$V_{IH(NRST)}^{(1)}$	NRST input high level voltage	-	$0.7*V_{DD}$	-	$V_{DD}$

$V_{NF(NRST)}^{(1)}$	NRST input unfiltered pulse	$V_{DD} = 3.3V$	300	-	-	ns

Notes:

(1) Guaranteed by design, not tested in production.

(2) The pull-up resistor is designed as a real resistor in series for a switchable PMOS implementation. The resistance of this PMON/NMOS switch is very small (about 10%).

**Figure 4-11 Recommended NRST Pin Protection**

Notes:

(1) Acts as a filter.

(2) The user must ensure that the NRST pin potential is below the maximum  $V_{IL(NRST)}$  listed in **Table 4-31**, otherwise the MCU cannot be reset.

### 4.3.14 Timer Characteristics

The parameters listed in **Table 4-32**, **Table 4-33**, **Table 4-34**, **Table 4-35** are guaranteed by design, not tested in production.

See section 4.3.12 for details on the features of the I/O alternate function pins (output comparison, input capture, external clock, PWM output).

### 4.3.16 I<sup>2</sup>C Interface Characteristics

Unless otherwise specified, the parameters listed in Table 4-38 were measured using ambient temperature, f<sub>PCLK1</sub> frequency, and V<sub>DD</sub> supply voltage in accordance with Table 4-4.

The I<sup>2</sup>C interface of the N32H482 product conforms to the standard I<sup>2</sup>C communication protocol, but has the following limitations: SDA and SCL are not "true" open-drain pins, and when configured for open-drain output, the PMOS tube between the pin and V<sub>DD</sub> is closed, but still exists.

I<sup>2</sup>C interface features are listed in Table 4-38. See Section 4.3.12 for details about the features of the input/output alternate function pins (SDA and SCL).

Notes:

- (1) The measuring point is set at the CMOS level: 0.3V<sub>DD</sub> and 0.7V<sub>DD</sub>.
- (2) The pull-up resistance depends on the I<sup>2</sup>C interface speed.

- (3) The resistance value depends on the actual electrical characteristics. The signal line can be directly connected without serial resistance.

### 4.3.17 SPI/I<sup>2</sup>S Interface Characteristics

Unless otherwise specified, the SPI parameters listed in **Table 4-39** and the I<sup>2</sup>S parameters listed in **Table 4-40** are measured using ambient temperature, f<sub>PCLKx</sub> frequency, and V<sub>DD</sub> supply voltage in accordance with **Table 4-4**.

See Section 4.3.12 for details on the characteristics of the I/O multiplexed pins (NSS, SCLK, MOSI, MISO for SPI, WS, CLK, SD for I<sup>2</sup>S).

Notes:

- (1) Guaranteed by design, not tested in production.
- (2) The minimum value represents the minimum time to drive the output, and the maximum value represents the maximum time to get the data correctly.
- (3) The minimum value represents the minimum time for turning off the output and the maximum value represents the maximum time for placing the data line in a high resistance state.

### Synchronous waveforms and timings

**Figure 4-25 through Figure 4-28** represent synchronous waveforms and **Table 4-48** through **Table 4-51** provide the corresponding timings. The results shown in these tables are obtained with the following FEMC configuration:

- BurstAccMode = FEMC\_NOR\_SRAM\_BURST\_MODE\_ENABLE, enable burst mode
- MemoryType = FEMC\_MEM\_TYPE\_PSRAM, memory type is PSRAM
- WriteBurst = FEMC\_NOR\_SRAM\_BURST\_WRITE\_ENABLE, enable burst write operation
- CLKDiv = 1, (1 memory cycle = 2 HCLK cycles) (Note: ClkDiv is the CLKDIV bit in the FEMC\_SNTCFGx register)
- DataLatency = 1 for NOR Flash; DataLatency = 0 for PSRAM

(Note: DataLatency is the DATAHLD bit in the FEMC\_SNTCFGx register)

Notes:

- (1) All voltage measurements are based on the ground cable at the device end.
- (2) USB operating voltage is 3.0~3.6V in order to be compatible with USB2.0 full speed electrical specification.
- (3) The correct USB function of the N32H482 series products can be guaranteed at 2.7V, instead of dropping the electrical characteristics in the 2.7-3.0V voltage range.
- (4) Based on comprehensive evaluation, not tested in production.
- (5) The chip has a built-in 1.5kΩ pull-up resistor, which is optional for the user.
- (6) R<sub>L</sub> is the load attached to the USB drive.

EO <sup>(4)</sup>	Offset error		1	3	
ED	Differential linear error		1	2.2	
EL	Integral linear error		2	3	

Notes:

- (1) The DC accuracy of the ADC is measured after internal calibration.  
(2) ADC accuracy versus reverse injection current: It is necessary to avoid injecting reverse current on any standard analog input pin, as this can significantly reduce the accuracy of the conversion being performed on the other analog input pin. It is recommended to add a Schottky diode (between pin and ground) to standard analog pins that may generate reverse injection current.  
(3) The forward injection current does not affect the ADC accuracy as long as it is within the range of  $I_{INJ(PIN)}$  and  $\Sigma I_{INJ(PIN)}$  given in Table 4-2  
(4) Based on comprehensive evaluation, not tested in production.

Figure 4-36 ADC Precision Characteristics

Figure 4-37 Typical Connection Diagram Using ADC

Notes:

- (1) For values of  $R_{AIN}$ ,  $R_{ADC}$ , and  $C_{ADC}$ , see Table 4-59.
- (2)  $C_{parasitic}$  indicates parasitic capacitance on PCB (related to welding and PCB layout quality) and pads (approximately 7pF). A larger  $C_{parasitic}$  value would reduce the accuracy of the conversion and the solution was to reduce  $f_{ADC}$  from medine.

### 4.3.25 12-bit DAC Electrical Parameters

Unless otherwise specified, the parameters of Table 4-62 are measured using ambient temperature,  $f_{HCLK}$  frequency, and  $V_{DDA}$  supply voltage in accordance with the conditions of Table 4-4.

### 4.3.26 Temperature Sensor (TS) Characteristics

Unless otherwise specified, the parameters in Table 4-63 are measured using ambient temperature,  $f_{HCLK}$  frequency, and  $V_{DDA}$  supply voltage in accordance with the conditions in Table 4-4.

**Table 4-63 Temperature Sensor Characteristics**

<b>Symbol</b>	<b>Parameter</b>	<b>Min</b>	<b>Typ</b>	<b>Max</b>	<b>Unit</b>
T <sub>L</sub> <sup>(1)</sup>	V <sub>SENSE</sub> linearity with temperature	-	±1	±3	°C
Avg_Slope <sup>(1)</sup>	Average slope	-3.7	-4	-4.3	mV/°C
V <sub>25</sub> <sup>(1)</sup>	Voltage at 25 °C	-	1.32	-	V
tSTART <sup>(1)</sup>	Startup time	4	-	10	μs
T <sub>S_temp</sub> <sup>(2)(3)</sup>	ADC sampling time when reading the tempearture	-	-	3	μs

Notes:

- (1) Based on comprehensive evaluation, not tested in production.
- (2) Guaranteed by design, not tested in production.
- (3) Shortest sampling time can be determined in the application by multiple iterations.
